

How to measure distances and bearings?

To compute distances and bearings between any locations:

- Move the screen center over the initial location and tap it **1**;
- Tap on **"Tools..."** **2** and on **"Measure"** **3**.

The **"Measure tool"** **4** side-view is displayed.

When you move the map center over any other location, the distance and bearing from the initial location to the screen center is previewed **5**.

- Tap **"Location"** **6** to set a destination location. You can repeat this process for any number of locations;
- To move over a particular location using its coordinates, you can use the **"Search"** **7** tool;
- If you want to delete the last location, tap **"Delete"** **8**;
- When you've done, tap on the **"Close"** **9** icon to save your measure and close the measure tool.

Your measures remain displayed on the map **10** until you manually remove them or delete them.

i Lines between measured locations are colored depending on the bearing: red when going north, blue when going south.
